1. What C keyword is used to define an alias for an existing type?

2. Derive the formula for the height / depth of a *balanced* binary tree as a function of the number of nodes, n, in the tree.

3. Write a C function called `toggle` that takes an `unsigned int` x and an `int` i as input and returns the resulting `unsigned int` after toggling the ith bit in x.
